Prepared by Greenlink Analytics

6 Years of Energy Burden Impacts:

Albuquerque in Focus

February 2021

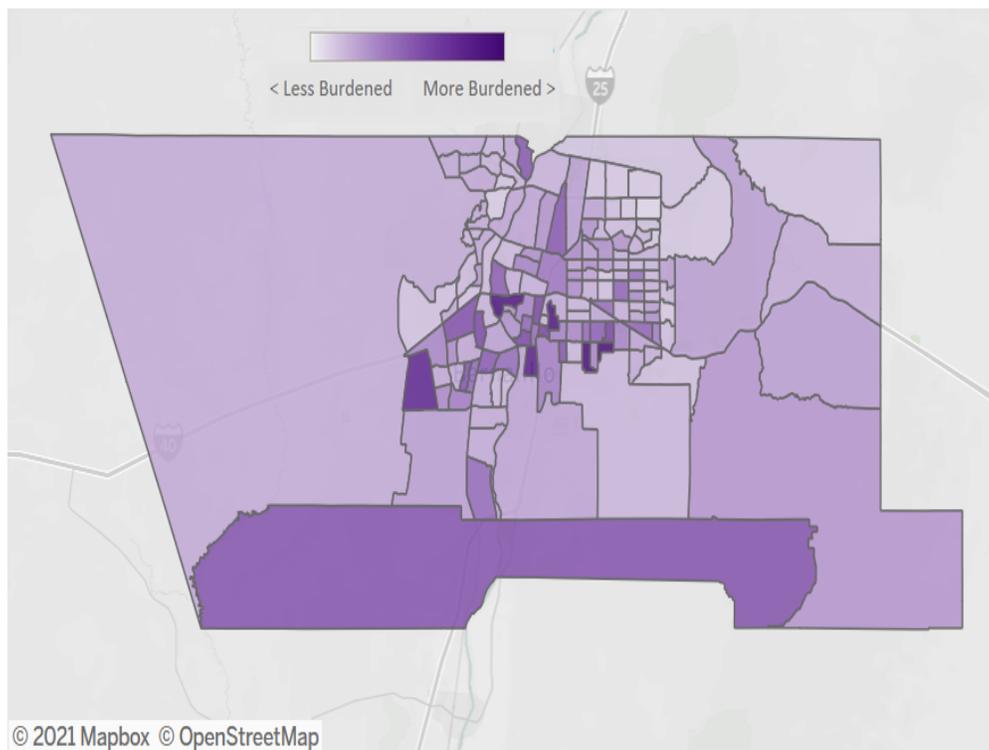

Figure 1. 2019 Albuquerque Energy Burden Ranges from 1% to 12%¹

Thanks to generous support from the Energy Foundation in partnership with Bloomberg Philanthropies, the 25 cities of the Bloomberg Philanthropies American Cities Climate Challenge (“ACCC”) are receiving a 6 Years of Energy Burden Impact report with information on the current energy burdens that residents of their city face, how that burden has changed over time, and how other equity indicators are related to energy burden.

¹ Clear tracts have insufficient data. Energy burden is the percent of income that a household spends on electricity and gas bills; an energy burden over 6% is considered “high” or “unaffordable” while a burden over 10% is considered “severe”. Albuquerque and Bernalillo County are used interchangeably in this report.

Energy Burden in Albuquerque at a Glance

On average, households nationally pay about 3.8% of their income on energy (gas and electricity) bills. Albuquerque is currently the **15th** most energy burdened city out of the Climate Challenge cities. Across the city, Albuquerque's average energy burden is 3.5% as of 2019, slightly less than the national average. When energy burden is mapped across the city by neighborhood (Figure 1), the data show that energy burden disproportionately impacts residents in the center portions of the city. For 2019, the 20% least burdened tracts in the city have an average energy burden of 2.0%, below the national average, whereas the 20% most burdened tracts have an average energy burden of 6.3%, demonstrating high energy burdens in these neighborhoods. The table below shows how Albuquerque compares on energy burden and how it's changed over time.

Table 1. Median Energy Burdens Over Time²

	2013 Overall	2019 Overall	Change
Albuquerque (Bernalillo)	4.1%	3.5%	-0.6%
New Mexico	4.9%	4.3%	-0.6%
25 ACCC Leadership Cities	4.4%	4.0%	-0.4%
National³	3.8%	3.6%	-0.2%

Albuquerque's Energy Burden: Change Over Time and City Disparities

In 2013, Albuquerque's median energy burden of 4.1% was above the national average, exceeding the national average (Table 1). It was below the New Mexico median of 4.9%. Energy burden in Albuquerque decreased by 0.6% by 2019, falling below the national average. This improvement was driven primarily by an increase in incomes, although average energy costs also decreased. Figure 2 shows how energy burden has changed over time tract-by-tract in Bernalillo county. Even though burden is decreasing city wide, neighborhood by neighborhood the story is varied. Many of the highest burdened neighborhoods are seeing worsening conditions at the same time as the city and country's energy burdens are improving. There are many reasons why energy burdens may fluctuate

² City by city energy burden for Climate Challenge cities found at the end of this document. Data from the Greenlink Equity Map (GEM) except where otherwise noted.

³ National data from the US Energy Information Administration (Forms 861 and 176) and the US Census.

year-to-year in an area including displacement, resident turnover, changing incomes, or rapid changes in energy usage behavior.

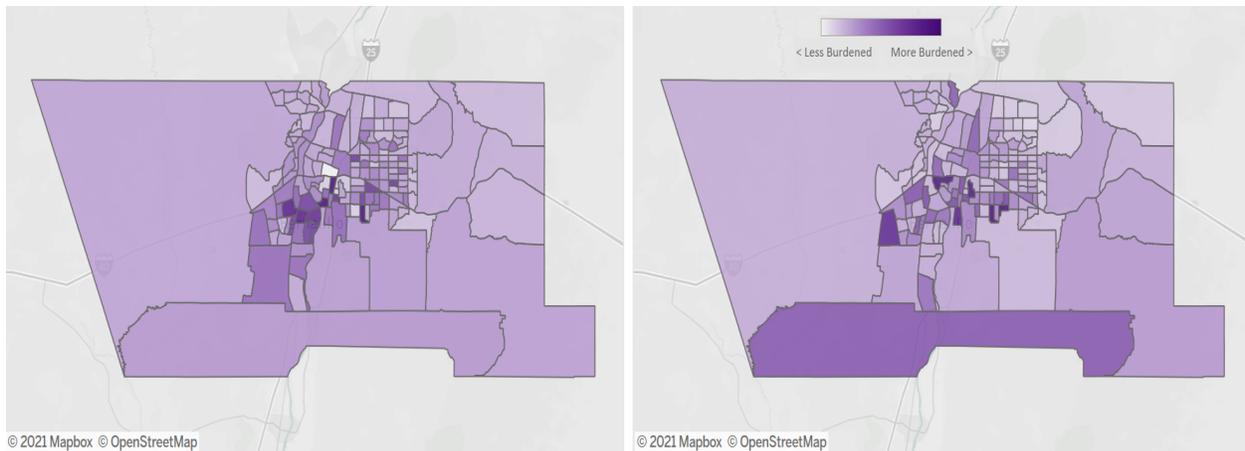

Figure 2. Albuquerque’s (Bernalillo County) Change in Energy Burden Between 2013 and 2019

The data show wide disparities between the top 20% most burdened and 20% least burdened census tracts in the city.⁴ The 20% least energy burdened tracts had a median burden of 2.5% in 2013 and 2.0% in 2019, beneath the national average in both years. By comparison, the 20% most burdened tracts in the city had an energy burden of 6.5% in 2013 and 6.3% in 2019, indicating continuing levels of high energy burdens in these neighborhoods across time. To look closer at how burden is impacting Albuquerque’s most heavily burdened communities, Figure 3 illustrates Albuquerque’s top 20% most burdened tracts in 2013 and in 2019.

⁴ Most and least burdened tracts are defined by the household-weighted average census tract energy burden from 2013-2019 and represent the top and bottom quintiles.

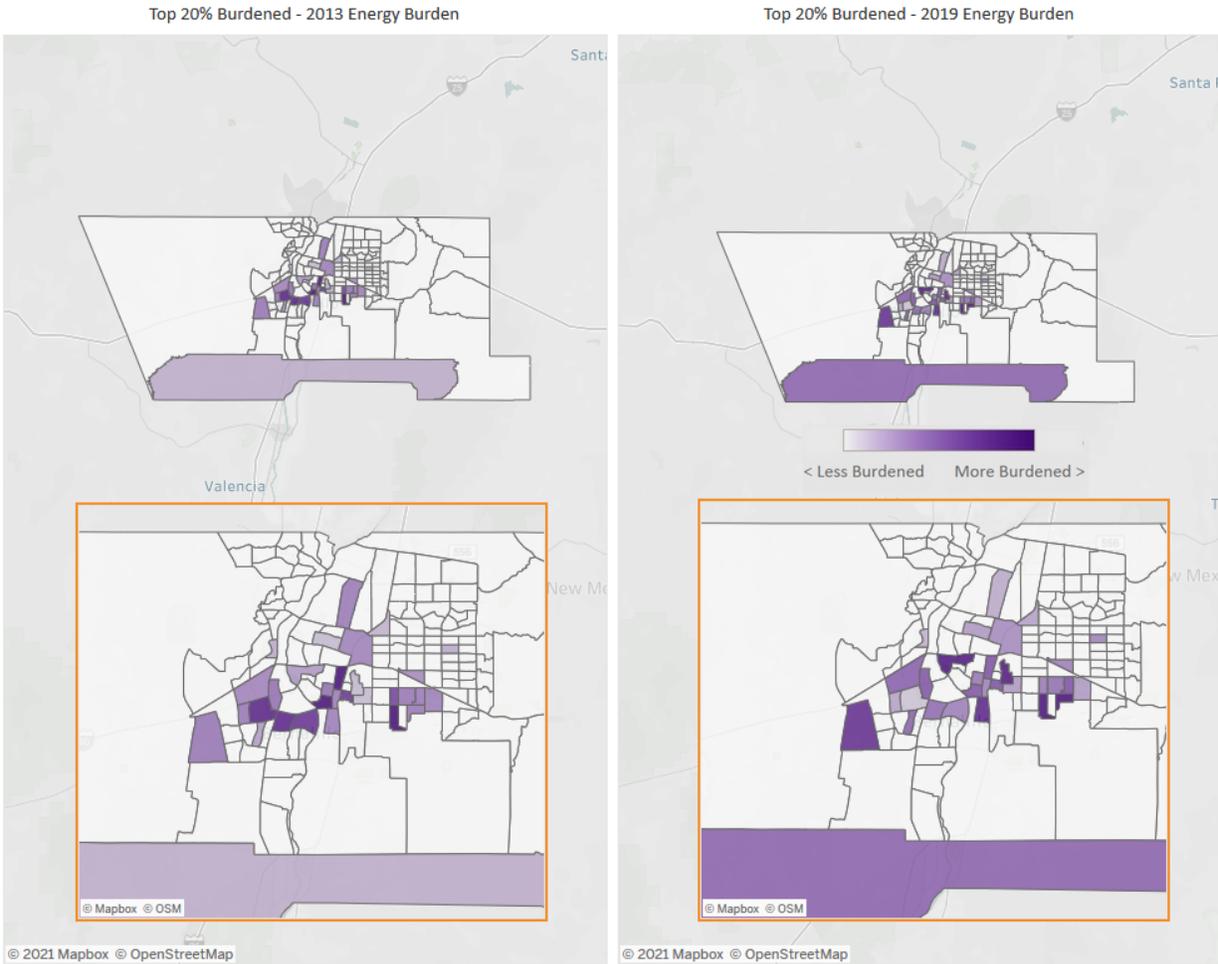

Figure 3. Albuquerque's Top 20% Most Burdened Tracts in 2013 and 2019

Figure 4 shows the highest burdened areas in the city that have seen their energy burdens markedly increase or decrease between 2013 and 2019.⁵ This demonstrates that while the average burden has been improving across the city, some of the most burdened areas are not sharing in these benefits.

⁵ Top quintile (20%) is shown, averaged across all years.

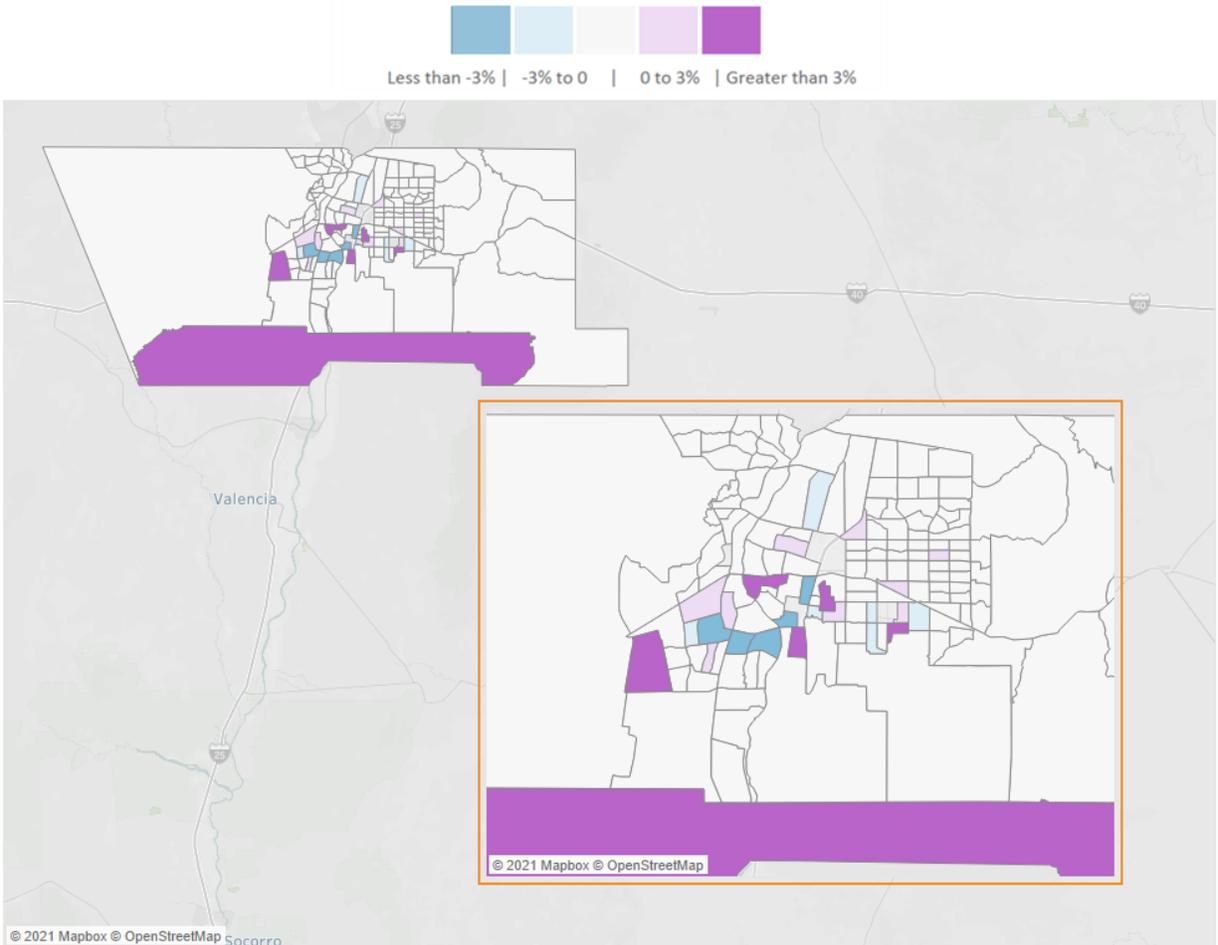

Figure 4. Change in Energy Burden in Highly Burdened Tracts since 2013

Table 2 shows how the number of households living in the most energy burdened parts of the city have changed between 2013 and 2019. Albuquerque saw its total number of households increase from 240,000 in 2013 to 248,000 in 2019.

Table 2. Number of Households in High and Severe Energy Burden

	High Energy Burden (> 6%)	Severe Energy Burden (> 10%)
2013	25,000	9,000
2019	23,000	7,000

Connective Issues: Equity Indicators Correlated with Albuquerque’s Energy Burden

Energy burden is concerning not only because of the financial strains it produces on its own, but also because it ties into and may deepen other equity issues. Many communities are simultaneously facing multiple equity challenges at once. Across these years of data, Albuquerque’s energy burdens are moderately correlated with poor health outcomes.⁶ Given these relationships, there may be opportunities to improve outcomes by increasing efforts that emphasize equity, health, and sustainability. Identifying these relationships may open doors for collaboration with other groups inside and outside of City Hall, ultimately advancing strong equity improvements across the city.⁷

Summary

- Albuquerque experiences average energy burdens 2.8% under the national average (3.5% in Albuquerque versus 3.6% nationally).
- Since 2013, energy burden has decreased by 0.6% across the city and 0.2% across the most burdened communities. The number of households with unaffordable energy costs has decreased by 2,000, although 23,000 continue to face high energy burdens.
- Over this time period, a 3.2x disparity exists in Albuquerque’s average energy burdens between the 20% least burdened and 20% most burdened communities, which highlights the need for additional resources to address energy burden in top burdened neighborhoods. This is the **twelfth greatest disparity** among ACCC cities.
- Energy burden in Albuquerque is connected to other equity issues like access to healthcare. Cities, counties, and other organizations may be able to work together across departments and agencies to share resources and come up with solutions that multisolve to address several issues simultaneously.

⁶ Energy burden is moderately correlated ($R^2 > 0.4$) with sleep deprivation, poor mental health, lack of access to healthcare, asthma, and pulmonary disease (and negatively correlated with predominantly white neighborhoods).

⁷ Albuquerque’s efforts to improve health equity may also improve energy equity and vice versa. Partnering with community and other stakeholders to “multisolve” on these issues may yield positive synergies when combined with strong processes. See <https://www.equitymap.org/process-guide> for assistance.

Energy Burden Across Climate Challenge Cities

	Median Burden 2019	Highest Quintile 2019	Lowest Quintile 2019	Disparity ⁸
Philadelphia	6.7%	13.1%	3.0%	4.4
St. Louis	6.7%	12.0%	4.0%	3.0
Indianapolis	5.9%	11.5%	3.4%	3.4
Cincinnati	4.9%	9.7%	2.8%	3.5
St. Petersburg	4.7%	7.4%	3.1%	2.4
Pittsburgh	4.6%	9.4%	2.7%	3.5
Atlanta	4.5%	9.7%	2.2%	4.4
San Antonio	4.5%	8.0%	2.6%	3.1
Boston	4.3%	10.6%	2.3%	4.6
Orlando	4.3%	6.7%	3.2%	2.1
Chicago	4.1%	9.5%	1.9%	5.0
Charlotte	3.9%	7.9%	2.1%	3.8
Saint Paul	3.7%	6.8%	2.3%	3.0
Columbus	3.6%	7.1%	2.1%	3.4
Albuquerque	3.5%	6.3%	2.0%	3.2
Los Angeles	3.5%	6.4%	2.0%	3.2
Honolulu	3.3%	6.0%	2.0%	3.0
Austin	3.2%	5.8%	1.9%	3.1
Minneapolis	3.1%	5.6%	1.9%	2.9
